actually not have read the message, but the tab, when selected even for a second, sends this notification on the chat window. Worst case scenario, you may actually not want to chat with someone, but this basically tells them you're ignoring them.

By checking in to a location on Four-square or mentioning it on Facebook, sometimes you may not realize that you're revealing your location to everyone on your friend list – even that mysterious guy you added as a friend and promised yourself you'd find out about some day but never got around to doing it. Ever realized that by default, Location Services for status updates and Messenger chats are active on Facebook? Why would you want everyone to know your exact whereabouts every time you post?

For those of you who show off the number of apps you've downloaded on your iPhone or Android phone, how many apps ask you to "connect to Facebook" and you say "yes" as a matter of habit? Essentially, you're giving these apps the full rights to post anything on your wall and access the details of your friends. Not only is your data being captured and logged, but you're also putting your friends and their profiles at some sort of risk.

That's not all the scare...

A group of advocacy organizations such as Electronic Frontier Foundation and Reporters without Borders, along with many activists and journalists, on 24th Jan 2013, published an open letter (<http://www.skypeopenletter.com/>) enquiring if Skype gives the government and police access to users' conversations had via voice, video or text on the network. The demand is for a regular "transparency report" informing the users of what data is collected and shared with which third-party entities and the retention policy for the same, among many other demands.

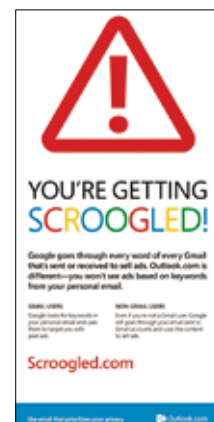

Still instagramming it?

There was much hue and cry after the popular photo-sharing network, Instagram, changed its terms and conditions with regards to the images uploaded by users. According to the new phrasing, Instagram can use any image for advertising/monetary gains, without having to confirm first with the uploader. The changes were rolled back, but Flickr made a bid for your attention when this happened by claiming to be honest about its policies.

Facebook Graph search: You cannot hide!

The latest to arrive from the popular social network is the Graph Search. The Graph Search results focus on four core points – people, places, photos and interests. Facebook can easily collate these results after having spent quite a few years urging users to upload information, interests and photographs to their profiles online. While some may jump around in delight as if 'stalking' has been legalized, most of us need to be worried. The so-called magic of Graph Search is that you can end up on that search any which way – if a person is

on Facebook – every photograph you've checked out, every profile you've visited and everything you've been linked to. While all this data is thankfully not shown on the profile or timeline (yet!), it may be petrifying to realize that Facebook has all that data. And with Graph Search only set to evolve further and go deeper than it is now, stalking someone with an attractive profile picture might lead to repercussions!

Bing's warning to you

Microsoft vs. Google, all over again

No, we're not talking about patents here. But the very pertinent issue of email privacy that Microsoft has raised for the second time. The www.scroogled.com campaign is so neatly designed that it makes the

consumer aware, yet brings in Microsoft's email service, Outlook.com, into the picture, very subtly! Just like it did last year, Microsoft has again targetted Google for reading through users' email to serve targeted advertisements. Google has always maintained that this scanning is done to identify and block spam and malicious messages. Microsoft responded by saying that it does the same scanning to identify just malicious content, and not exploit that data to serve relevant advertisements. Although these mails are machine read and while this seems like a fairly noble idea, we're not so sure how reading of mails can be properly justified. Making money off of your personal email via advertisements at the end of it may be bordering on the unethical, but equally, no advertisements doesn't mean that the act itself is justified. Conversely, with the amount of spam floating around, we're not sure if we can survive without these techniques, and the only way you can be careful is to not share sensitive data on these networks.

All in all, you're still the master of all that you upload. Being sensible is a starting point for keeping your online life at least somewhat private. **d**

Your profile isn't safe from Graph Search results

directly trying to dig in your profile (Photos of XYZ from Paris), or even if they're randomly searching for anything remotely linked to you (Friends who like BBC Top Gear). There really is no hiding from it.

Now let's put this into perspective. Ever checked out a feature on your Facebook profile called Activity Log? This has a scary log of every single click of yours
