

## Flickr updated for iPhone

Yahoo released an update for Flickr iPhone app which adds features like faster uploads, tagging, volume shutter and more. <http://dgit.in/158Txo7>

## LG Phones leaked

LG's new handsets, the Optimus F5 and the Optimus F7 were leaked online even before their launch at MWC. <http://dgit.in/UQ6WPY>

reinstalling Windows on the same drive. Don't format your drive, just reinstall Windows. Your old Windows installation and all the data in My Pictures, My Documents, etc., will be stored in a folder called Windows.old in the C Drive. But before you do that try out the Start Windows Normally option.

### Router as a Wi-Fi receiver

I have a TPLink TL WR740n router which is connected to my PC which has Windows 7. I want to use it as a Wi-Fi receiver for my PC as I tether my Android via Wi-Fi and want to use my phone's 3G net connection on my PC without taking out SIM or connecting it with USB. I don't have a broadband connection at my home and I don't want to use an ethernet cable.

*Jacob Simpson*

**A** Unless the router you have can work in a repeater mode (which your specific model doesn't support), it will not be possible to share the internet connection over Wi-Fi via the phone, through the router. Your best option is to directly connect the phone to the PC via Wi-Fi (if your PC supports it) or USB.

### HDDs dead or alive?

I have two Samsung HDDs (SV0411N and SP4002H) since the year 2004. I was using them both with my PC since 2004 and both of them stopped working simultaneously. Now I'm using a 2011 model of Lenovo laptop, but I need to recover the data inside both of the HDDs.

One of the HDD makes a wierd knocking noise whenever it's plugged in. Most probably I think the problem is with the motor mechanism or something is jammed inside. The other HDD I think is dead as it does not work at all, no spinning, not even any noise. It's been one and a half years since the HDDs stopped working. My questions are:

- 1) Can I myself repair the HDD and recover the data? I don't have a PC now, it's a laptop.
- 2) Is there any special cable available to connect the HDD to the USB port of my laptop and is it possible to recover the data that way? I'm not sure if the HDDs work now.

- 3) Is there any Samsung repair centre / data recovery centre near Calicut, Kerala from where I can get the HDDs repaired?

*Sulyab TV*

**A** If your drive is making any sort of noise, that means it is going to go bad soon or has already gone bad. Connecting such drives is a hit and miss affair. But whenever it connects you need to quickly backup all the data within that drive to a working drive.

Repairing a drive is a specialised job which requires complete knowhow of all the working components. It will be very difficult to repair the drive on your own, as it has a lot of minute components and you need the right instruments to open up a drive and recovery of data from the platter is an altogether different expert area.

You do get SATA to USB adapters in the market which allow you to transfer data, but if your drive as you say, is not working or spinning, then for all practical purposes it is dead.

Samsung HDD department has been sold to Seagate, so you will need to enquire with Seagate regarding repairing of your Samsung HDD. This is the Chennai enquiry number: 044 4224 3535. Do enquire on this number. Most probably since these drives are out of warranty, you will need to pay data recovery charges. There is no point getting it repaired, just recover the data and get a new drive.

## From the Thinkdigit forums:

### Low Power software?

I keep my PC on for downloading for long durations, sometimes for three or four straight days. I was wondering if there is some software which could make it run in a low-power mode just enough for downloading? I find it meaningless to have the desktop at full power just for some simple task like download.

*ithehappy*

**A** You don't need a software for that, just go to Control panel > Power Options. Click on "Change plan settings" in front of power saving and set everything to 'maximum power saving'.

### Change power saver settings

and CPU cooling to 'passive' instead of 'active'. Other than that, you can enable all power-saving features available in your BIOS. No software is needed. You can underclock and undervolt your CPU.

### Modem-router conflict

I bought a new TP Link TL-WR841N WiFi router last month and connected it with my Airtel BX 220 modem and it worked fine. But recently Airtel modem started giving some problem and on lodging a complaint, the airtel technician changed it with one of my old available modem ie. Huawei Smartax MT 880. After configuring the modem, we observed that Huawei modem was working okay when connected directly to desktop through Ethernet cable, but when connected through TP Link WiFi router it was not providing any connectivity either through the Ethernet cable or Wi-Fi.

Right now I am still using Huawei modem directly connected with the desktop. I want to make TP link Wi-Fi router operational for using my notebook, mobile etc.

Kindly suggest if there is any solution for this issue or I may have to buy a new modem which is compatible with TP Link?

*Arayman*

**A** I think your modem is in PPPoE mode in which your username/password is saved in modem and you get connected to the net by just turning on the modem. You have to set your modem in bridge mode (just search Google for your modem model along with bridge mode or ask the technician, it's really very simple). Your router is already configured in PPPoE mode with your username/password. Once modem is set in bridge mode, connect as earlier and it should work just like before.
