Managing your Media collection using Plex

Siddhant Sharma

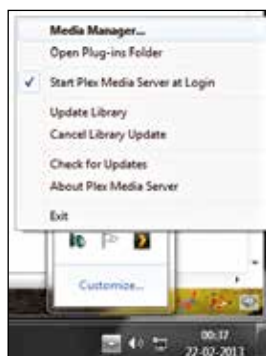

readersletters@thinkdigit.com

What is Plex?

Plex or Plex Media Center is a partially open source, XBMC-like, freeware media center software which uses the 10-foot user interface (Interface designed for large screens). It expands the way in which you can play media on your devices by adding remote capabilities, and also providing a host of features thereby increasing functionality. It also allows you to manage and play videos, photos, music, movies and podcasts efficiently. The main component of Plex is its front end Plex Media Center which operates from a local or remote computer running the Plex Media Server. Plex also has an integrated online service which provides plugins for online content from sites such as Netflix, CNN etc. The best part about using Plex is that it works directly from your browser and supports a range of multimedia formats and as a media center it can play most audio and video file formats. It can also display and play content from sources such as USB Flash drives, CD/DVD-ROM drives, internet sources and also your local area network. The software also supports HD video decoding of H.264 video files. You can control Plex using mobile apps too. So in a nutshell you can stream your added content remotely from portable iOS or Android devices or at a computer terminal by just getting logged into your Plex Media Server.

Getting started with Plex Media Center

Before you start using Plex, you first need to set it up by downloading it. So head over to: <http://www.plexapp.com/getplex/>

Select Media Manager from Plex's tray icon

Follow the easy instructions and add content to your Library

www.plexapp.com/getplex/ and download Plex for your particular operating system. Once you've finished downloading it, you should start the Plex installation wizard and complete the installation. It may ask you to provide permission for installing "Bonjour x86", which is a component of Plex, so choose "Yes" and finish the setup.

When you finish installation, a Plex icon gets added to your system tray in the notifications area. You need to right-click the icon and select "Media Manager". You'll notice that your default web browser opens up and you are greeted by Plex. Now you need to register yourself by providing your email ID and other credentials. Once you have an ID, login to your account and assign a name for your media server by going into Preferences (even when you don't assign a name for your server, Plex adds your default system name as the Media Server name)

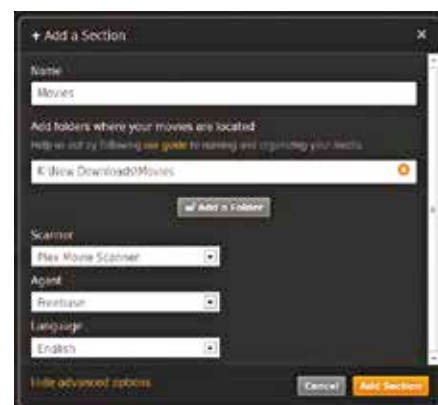

Adding content to your Plex Media Server

Now you'll have to start adding content to your Plex Media Server for streaming. Start by adding movies, music, videos and photos from your com-

puter by browsing for files and selecting folders which contain such media. For e.g. To add a particular movie to your Plex Media Server, Click "Add Section" or "+" button on your Library menu > Select the type of Media (in this case Movies) > Name your Movie Library > Click "Add Folder". Browse for your Movies folder on your computer, then select a particular folder which has your desired content. Add Folder > Add Section. When you finish this process, Plex Media Server starts scanning the selected files for content and adds them to your Movies library. You need to follow the same procedure to add any other type of media on Plex. Once media is added to your "Media Library", Plex downloads the media information for all of the added content from the Internet.

Managing content

One of the many uses of Plex is that you can manage your added media content-

Edit your selected section in this window

very efficiently. To do this Plex provides users with the option to add sections in your library. Using sections, you can separate files and distribute them to where you want them to be or you can just organise your library. If you have selected a wrong
