

Available formats:

```
22 : mp4 [720x1280]
45 : webm [720x1280]
35 : flv [480x854]
44 : webm [480x854]
34 : flv [360x640]
18 : mp4 [360x640]
43 : webm [360x640]
5 : flv [240x400]
17 : mp4 [144x176]
```

You will then have to run the command again specifying the code format that you want to download. Continuing the above mentioned example, if one wants to download the 720p version of the video the new command would be:

```
youtube-dl -f22
http://www.youtube.com/
watch?v=0tHqov_UHYA
```

Subtitles are currently available for YouTube links only, to download a video's closed caption to an .srt file, just add `--write-srt` option to the command to save the subtitle along with the video. For YouTube you can also mention the language in which you want to download the subtitles just use the `--srt-lang` option followed by IETF language tags like 'en' or 'fr' to download the subtitles in that particular language.

Batching and playlists

If you want to make yourself a YouTube mixtape or download a set of videos from different websites, you can batch download them using youtube-dl. All you need to do is add all the URLs to a file, each one on a new line and save the file with a .txt extension. You can then ask youtube-dl to read the URL from a particular file using the `--batch-file` option, like this:

```
youtube-dl --batch-file
/path/to/batch/file.txt
```

In case you want to enter the URLs one-by-one directly into the command line itself you can write '-' instead of the path to the batch file to instruct youtube-dl to read from stdin.

Youtube-dl has this particularly nifty feature which allows you to download entire playlists from YouTube. Infact it supports downloading playlists, channels, all videos for a particular user and even search results. You can do this by just providing the relevant link to youtube-dl, it'll handle everything else for you.

Auto resume and rate limiting

By default, youtube-dl resumes file download from where it was interrupted. You can change this behaviour by adding the `--no-continue` option to restart downloading a file from beginning when interrupted. You may also want to add `--no-overwrites` option to ask youtube-dl not to overwrite files, but create no ones.

If you're sharing your bandwidth with other terminals, you can also control the download speed for youtube-dl thereby limiting the bandwidth it consumes, by passing the `--rate-limit` option along with the speed you want to limit it to. This is particularly helpful on slower connections. Eg.

```
youtube-dl --rate-limit
60k http://www.youtube.com/
watch?v=vQVeaIHWwck
```

Youtube-dl works even if you're behind a proxy. You can instruct it to download the videos through the proxy by setting the environment variable `http_proxy` to the proxy url, it should look something like this `http://proxy_machine_ip_or_name:port`.

Extract audio

Youtube-dl allows you to strip the audio from the downloaded file and store it as an audio file in numerous formats, making it very easy to download entire playlists as MP3 files. To do so just pass `-x` option to convert the video files to audio-only files. Mindwell

this requires ffmpeg or avconv and ffprobe or avprobe, these are generally found on nearly all modern Linux OSes. If you don't have it installed on your system, you can grab the latest version from your distro's package manager. Windows users, don't fret, as you can download the latest ffmpeg build for Windows from the following URL: <http://ffmpeg.zeranoe.com/builds/>.

You can control the audio format the downloaded file is saved in by using the `--audio-format` option. It will default to 'best' which will download the best quality available for download. You have an option to save in either of AAC, Vorbis,

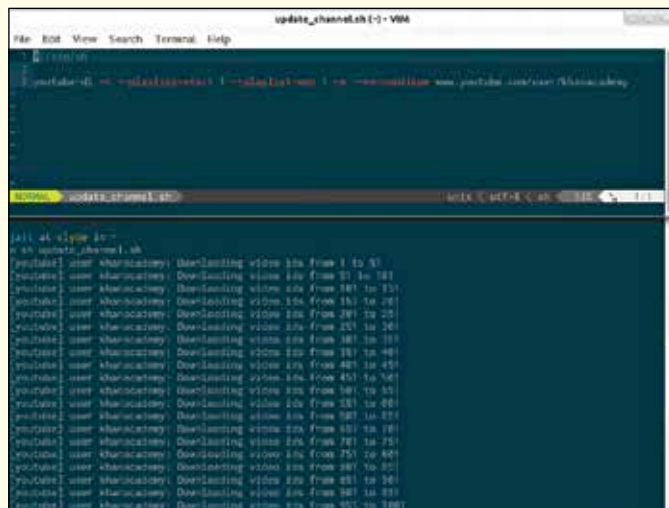

passing the `--recode-video` option followed by the format. The video formats currently supported are MP4, FLV, OGG and WebM.

```
youtube-dl -x --audio-
format best --audio-
quality 9 -k --recode-
video webm http://www.
youtube.com/watch?v=Sq
DP2OtKtMc&playnext=1&
list=PL8E392AEF40B0D93B
&feature=results_main
```

Auto-download channel updates

The first thing we require here is a shell script or a bat file which will contain the command which will run youtube-

Channel update script in action

MP3, M4A, OPUS and WAV formats. You can control the audio quality by passing the `--audio-quality` option where you can control the ffmpeg/avconv audio quality spec. by inserting a value between 0(better) to 9(worse) for variable bitrate (VBR) or you can go ahead and specify a bitrate viz. 128k, which is the default.

One thing to look out here is that it deletes the video files after converting them to audio. You can instruct youtube-dl not to do so by adding the `-k` option. Along with the `-k` option you can also instruct it to transcode the video into specific format by

dl. Open up your favourite text editor and enter the following command into it:

```
youtube-dl -t --play-
list-start 1 --playlist-
end 1 -w --no-continue
<<URL of your choice>>
```

This command will download only the first file in the playlist or channel. We've also added the `-w` command which doesn't allow overwrites. This makes sure that you only get the most recent video. The only downside here is that you need to make sure that you include the video id in the output filename to make sure that you don't overwrite files.
