

Based on WxPython Widget Toolkit, you don't need to install it

Now save the file as .sh in Linux or .bat in Windows. You can now go about automating the downloading in two ways:

1. Cron or Schtasks

In Linux, fire up the crontab using the `crontab -e` command. This is your cron job editor. Now a cron job is laid out like this:

```
minute (0-59), hour
(0-23, 0 = midnight),
```

```
day (1-31), month (1-12),
weekday (0-6, 0 = Sunday),
command
```

In our case, we want to run it at 12.01 PM every day, the cron entry would look like this:

```
01 12 * * * /path/to/
our/script
```

It would be prudent to split downloads from different channels//playlists in different files, otherwise the commands would be executed sequentially if

they're added in the same file on different line. You can tweak the script run time to the one that suits you. You can read up more on cron here: <https://help.ubuntu.com/community/CronHowto>

Windows uses schtasks to schedule tasks and you can follow the comprehensive documentation here: <http://technet.microsoft.com/en-us/library/cc725744.aspx> to run the .bat file at the time that you desire.

2. System startup

Instead of fetching videos at a particular time of the day, you can look for new videos only when you boot your system. On Windows you can use schtasks itself, the resulting command would look something like this:

```
schtasks /create /tn
"youtube-dl" /tr \path\
to\bat\file /sc onstart
```

It's a bit convoluted to implement this in Linux, you would want to start the script once you

log into the system. On Gnome based systems you can source the path to the script to ~/.gnomerc file, which makes sure that the command is executed each time you login. On KDE based systems you can source the path from ~/.config/autostart file. You could also do this in your .bashrc but then it'll run every time you open your terminal.

GUI

If you're not comfortable using youtube-dl in its native command line format, you can use the GUI developed by Freddy Wijaya. The code is quite old and has not been updated since August 2012. You'll miss out on some of the better features that the later versions of youtube-dl have to offer. Head over to its download page at Google Code and grab the latest version. The GUI is currently available only for Windows and Linux, sorry Apple users.
