

ANDROID JELLY BEAN 4.1

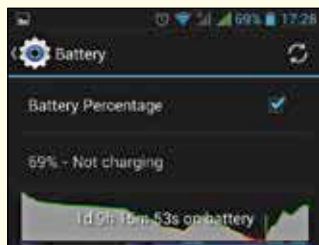

Info on lockscreen

Want to add a hint of your personal touch to the lock screen apart from a mere personalised background? How about displaying your name and other details on the phone's lock screen such as email address, your twitter handle? It just adds a bit of zing to the otherwise blank lock screen. Go to Settings>Personal>Lock Screen on some phones or Settings>Personal>Security>Owner Info. Make sure that the 'Show owner info on lock screen' box is ticked and then enter your details in the space below.

Battery life indicator

Many times the mere battery bar does not elicit much infor-

Battery Percentage Indicator

mation except when it changes colours to indicate critical battery life. The best option to get the battery life value in percentage is to download the many battery apps out there. But you can activate that option from the settings itself. Go to Settings>Device>Battery and tick on the Battery Percentage box.

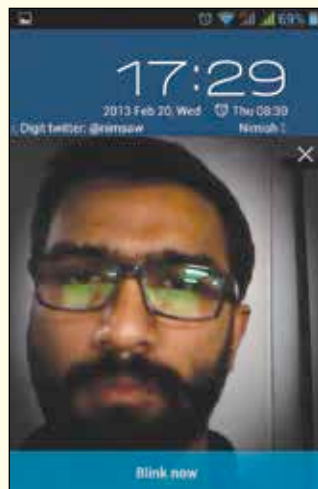

Liveness feature

Jelly Bean allows you the option to unlock your screen by using Face unlock option. But the inherent risk associated with that includes someone placing your picture in front of the camera while unlocking the phone. So in order to make this face unlocking fool-proof,

a Liveness feature needs to be activated. This feature will prompt you to blink your eyes when you're unlocking the phone with your facial image. The phone will unlock only when it detects a quick shut-eye movement. Quite a nifty addition we must say.

Go to Settings>Security>Screen Lock>Face Unlock. You will need to keep your face within the demarcated space and let the phone recognise it. Then it will prompt you to enter a pattern unlock code, in case the facial get up changes from the time the face unlock was set up (heavy makeup, growing facial hair, etc.). It will then open up more options under Screen Lock such as Improve Face matching, Liveness check, Make Pattern visible, etc. Make sure that Liveness Check box is checked (it is by default).

Liveness Check Blink Now

Camera gallery gestures

With the Jelly Bean OS, the Android camera gestures have got a shot in the arm. After you have clicked a picture and want to review it, you can just swipe to the left and you will be able to see the last shot. On pinching the image, it shows a film-reel sort of view and you can swipe and fling images up or down to delete them. You also get a prompt to Undo Delete, every

Current camera view on the left and gallery image on the right

time you delete any image by swiping it. You do not need to get out of the camera application to review images or delete them. After you are done reviewing and/or deleting the images, you can swipe to the right till you get to the live view of the camera.

Video features

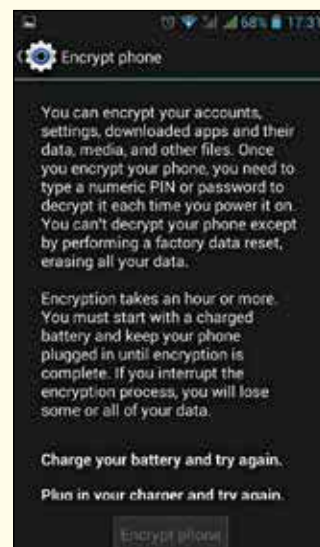

While recording videos, you can now pause a video, and then resume recording it. You will still get one single file and you do not need to stitch them separately. This is quite a relief for someone who is not really keen on stitching videos after they have been shot. You can also take still pictures while recording a video.

Encryption

Data protection is important specially since we have a lot of personal data on our Android devices these days. You surely do not want any hacker to get access to it wirelessly, and misusing it. Encrypting your data is one way of ensuring it does not happen. Encryption basically scrambles all your data such that it can only be read after entering a password which will decrypt the data. In case your phone gets stolen and if you do not have any remote wiping software (we recommend you have one installed), the hacker cannot connect the phone to his system and transfer your data.

Go to Settings>Security>Encrypt your device or Settings>Encrypt your device. Make sure your device

Encrypt your device

is connected to a power source, as the process of encrypting your device can take an hour or so depending upon the amount of data on your phone/tablet.

Notification tips

Jelly Bean really spruced up the notification tab for users. The notification screen can be accessed by swiping from top to bottom, as was the case with previous Android OS versions. On the top you have the regular icons which activate or deactivate phone operation modes, Wi-Fi, Bluetooth, auto-rotation lock and so on.

The notifications in Jelly Bean support gestures: you can get rid of the gestures by swiping them to the left or right

You can use a two-finger gesture to expand a notification. For instance if the notification reads six mails, then you can use a two-finger pull down gesture to expand that notification such that you can see the subject line of each mail.

Certain apps even have call-to-action features associated with notifications. For instance, if you get a missed call notification, you get the option to either call or message the concerned person right from the notification itself; if you want to share a screenshot you have taken, you
