

have the share button right below the screenshot notification. Music notification comes with the play/pause, stop, rewind or forward buttons so you can control the music player without necessarily going into the app and so on.

Reboot in safe mode

Android allows you to side-load third party applications, but not all of them may be safe. Some apps may cause issues and lead to crashes, freezes or battery life issues. Sometimes it is very difficult to pinpoint which app is causing trouble. So just like you would in Windows, in Android Jelly Bean, too, you can reboot your device in safe mode. By rebooting into safe mode, Android will not load any third party apps. To restart in safe mode, long press the Power button till you get the Power Off notification screen. Long hold onto the Power Off option, and you will get the prompt to Restart in Safe mode. Click OK and let the system restart. You will see Safe Mode on the bottom left hand side of the screen.

Now if you know the application that is causing the trouble, you can directly go to it from the Settings>Apps and uninstall the faulty app. If you do not know which app is causing the trouble, then either you can uninstall all third party apps and then reload them individually or do a factory reset after, of course, backing up your data.

Accessing app info

To access the information of an application one generally had to go to Settings>App, but in Jelly Bean, you can go to the App info screen right from the notifications tab itself. You can long press on the notification of a particular app and you get a popup saying App Info, which directly leads you to the app settings menu from where you can take the relevant action for that particular app.

Inverted view

Regular view

Inverted reading to save battery

You generally have black text on white pages and if you are fond of reading long articles on the web, you will notice a marked difference in experience if you have a white text on a black background. This is called inverting the screen where colours are displayed as their opposite. It does save on battery life, but it definitely makes your LCD screen much more readable in bright sunlight as opposed to the regular mode. Go to Internet Browser>Settings>Accessibility>Inverted Screen Rendering. Select the Inverted Rendering checkbox. If images are important to you, then you might want to skip this tip. This is only applicable if your main concern is with reading text on the webpage.

ANDROID BACKUP

Switching phones every 18 months or so is something that people have just taken for granted these days. Where Apple and Windows Phone have quite a decent system for managing your phones, Android, despite its widespread use and popularity, still seems to lag a little behind when it comes to developing desktop applications that support convenient backups. Most manufacturers, such as Samsung and Sony, do provide their own apps but if you're a regular modder who can't sit with the same ROM for too long, you might be in a bit of a pickle. Without further ado, here are some tips to get your Android phone all backed up and secure.

SnapPea

You can download SnapPea from <http://www.snappea.com>. It is a free tool and one of the best we've seen at backing up your device. It also does more than just backup, as you shall see.

Download and install the program and also download the app on your phone, from

Sketch your imagination
