Corsair Neutron 240GB

GS. This was the first Corsair drive to incorporate the Toggle-mode NAND chip, which gave it a better performance boost as compared to the Force GT. Before the Neutron GTX came out, this was the flagship Corsair SSD.

Intel had just one drive – the Series 335 – this time around. The Series 335 is not very different from the Series 330 except for the fact that the former has 20nm NAND modules as opposed to 25nm ones seen on the Series 330 as well as the older Series 520. In fact, the Series 520 was the winner of the Best Performer award in our last comparison test till Corsair Neutron GTX came along. The Intel Series 335 SSD houses a SandForce SF-2281 controller and has eight synchronous IMFT MLC NAND chips (16 GB each) on either side of the PCB amounting to 256 GB. Out of this total, 16GB is used for over-provisioning hence the marketed capacity is 240GB of which space accessible to the user is around 223.57GB. It comes with a 3.5-inch SSD tray to lodge the drive in your chassis.

Kingston also had only one drive this time around – the

SSDNow V300 – which is an update to its popular value-oriented SSDNow series drives. We were expecting the HyperX 3K SSD but alas, that drive is not selling in India so Kingston could not provide it. The V300 is typical SSDNow series drive with similar design of the grey enclosure. We were pleasantly surprised to see a 7mm profile and the box also comes with an external casing with a miniUSB to USB 2.0 (seriously?!) cable. The box also bundles a cloning utility CD which has the Acronis True Image HD cloning tool to replicate your existing HDD onto the SSD. On opening the enclosure we notice thermal pads protecting the NAND modules at the same time helping contain heat. It houses a SandForce SF-2281 controller along with 16 Toshiba MLC NAND modules of 8 GB each. So of the total of 128GB, 8 GB goes towards over-provisioning for the SF-2281 controller.

ADATA had the most number of SSDs in the test: two from the SX900 series and one from the SP900 series. Now despite all these SSDs having a SandForce SF-2281 controller within, we still notice that they
