SONY

Sony posts losses

Sony posted a net loss of about \$115 million for Q3 2012 between October to December. More here <http://digit.in/14UDX00>

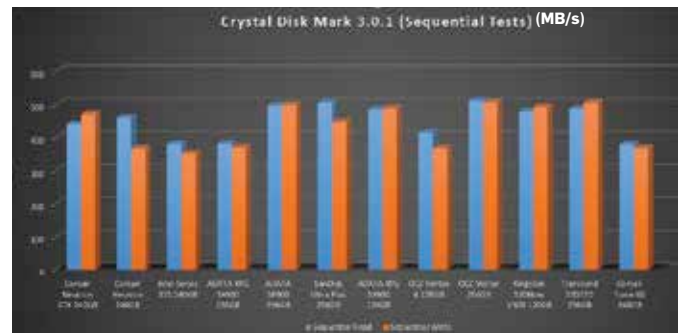

SSDs Test

modules. In the 4KQD32 test we noticed that some drives gave much higher write speeds for compressible data than incompressible data. Here again the Corsair Neutron and OCZ Vector gave the highest speeds of over 350MB/s.

With the AS-SSD tests, you deal with only incompressible data unlike with Crystal Disk Mark. Here again, the OCZ Vector and Corsair Neutron were the best of the lot. Kingston, Transcend and ADATA SX900 128GB drives performed poorly with sequential write as compared to sequential read. As far as the input/output operations (IOPS) went, the OCZ Vector and Corsair

Neutron comfortably crossed the 80,000 IOPS mark (Vector crossing 90,000) for read operations and 75,000 IOPS for write operation. Kingston SSDNow had the lowest score in this test.

Coming to the PC Mark 7, we ran the secondary storage test which involves simulating importing pictures, starting applications, editing, among other things. We got an overall score and also noted the data transfer rate of each individual task. Apart from the ADATA SP900 which had the lowest score of 4298, all other SSDs scored over 5000 marks with the OCZ Vector scoring the maximum at 5404 marks.

Real-life benchmarks

Coming to the real-life tests, where we transferred 8GB sequential and assorted files between the SSD under test and the RAID0 configuration of two Corsair Neutron GTX SSDs. In the sequential write test only Corsair Neutron, SanDisk Ultra Plus, OCZ Vertex 4, OCZ Vector crossed the 300 MB/s speed mark whereas all SSDs except ADATA SP900 managed to achieve it during sequential read test. When it came to Assorted write speeds, none of the SSD managed to cross the 300MB/s mark but Corsair Neutron and the OCZ SSDs cross the 250MB/s which was quite impressive. During the intra-drive transfer the Corsair Neutron, SanDisk Ultra Plus and OCZ vector were impressive with sequential data crossing 160 MB/s whereas with assorted files Corsair Neutron, Intel Series 335, OCZ Vector were good.

VERDICT

As you may have already realised from the charts above, there was a close fight between Corsair Neutron 240GB and OCZ Vector 256GB drives. Ultimately the OCZ Vector 256GB drive scored higher and has bagged the award for the Best Performer. In terms of overall score, it just edged past our last year's Best Performer – the Corsair Neutron GTX 240GB SSD.

When it came to the Best Buy, there was a fight between the SanDisk Ultra Plus 256GB and Intel Series 335 drive. But the performance offered by the SanDisk drive was quite impressive and it offered it at a great cost per GB hence SanDisk Ultra Plus was awarded the Best Buy.

The Editor's Pick went to Corsair Neutron 240GB drive for its supreme performance at a decent cost per GB. It was next only to the OCZ Vector. **[1]**
