

Console gaming at 35,000 feet

Singapore Airlines now allows you to play 15 console games in its in-flight entertainment system on its Mumbai - Singapore route

Fallout shelters

Check out a list of some of the creepiest Cold War Fallout shelters here: <http://dgit.in/WexfeR>

location of the capacitive buttons below the display, charging port and the camera are quite similar. With respect to the touchscreens on the respective devices, the Karbonn A9+ has an IPS display whereas the A30 sports an LCD screen.

The Lava Xolo X500 is really tiny with a 3.5-inch display. Being this small, the device does feel a hair thicker than we'd like but that isn't necessarily a bad thing. It is comfortable to hold courtesy the rubberized rear finish. Typing on the screen in portrait mode might take a bit of getting used to because of the small display. One design flaw that we have with the device is that the power button and the volume rocker on the device are quite slim and there is no

flex in them – they are a little difficult to find especially if you are someone who likes to change the phone's volume or put the device to sleep without looking at it. These buttons feel very tightly integrated into the spine of the device.

The Sony Xperia Tipo has the smallest screen at 3.2-inches. This makes it small, cute and cuddly to look at but hampers the experience when it comes to typing. Not because of the keyboard layout but because the phone feels so small in one's hands. The build and finish of the device is nice. It has a plastic back with a gunmetal finish making it look sturdy. It has a more stylish design than the X500 and also compromises on the front facing camera.

The HTC Desire C also joins the small and cute device category as it has a 3.5-inch display and a really compact form factor. It has a rubberized back adding to the grip. Being on the smaller side, the device may not appeal to all. The camera also compromises on flash. Just like other HTC devices, the device is very well built.

Next up, we have a 5-inch smartphone, the Intex Aqua 5.0. It looks like a brick and a bigger version of the Intex Aqua 4. The display has a square design to it rather than the rectangle look we are familiar with. This isn't a bad thing for regular use but makes typing in the landscape mode a bit uncomfortable. It is one of the heavier phones on our list. In its overall design, it isn't the most comfortable for single hand use.

At 4.5-inches, the Karbonn A21 has a very comfortable form factor. It has a rubberized back adding to the grip. The standard four capacitive buttons are present at the bottom. We think that in terms of design, the 4.5-inch form factor is great for browsing the Internet, using the onscreen keyboard and for some multimedia content.

The Xolo A800 has your run of the mill 4.5-inch design but for its price, the device feels very well built. It has a simple matte white back but feels very comfortable to hold.

The Micromax Canvas 2 A110 has a Samsung Galaxy Nexus style curved design and it has mimicked this design element quite well. The textured back adds to the grip and the bulged volume rocker and power button are conveniently placed. The Micromax A116 Canvas HD looks like a more sophisticated version of the Canvas 2. The build of the device is very good considering the price point but

it could have been even better. The rear of the device is plasticky with a pearl white finish. It is also glossy making it a fingerprint magnet. The device is really light and considering the large 5-inch form factor is very comfortable to use. The device also has a curved design, like the Galaxy Nexus adding not only to the build but the good looks of the device as well.

The Spice Stellar Virtuoso has a very iPhone-ish design, if we may say so. It has a very simple design, removing all the curves and slants found on other devices. This is a good thing if simplicity in design is the thing for you.

Next up we have three devices from Nokia – the Lumia 510, 610 and the 710. The 510 has a 4-inch display whereas the other two have a 3.7-inch display. Their build is very reminiscent of each other. All the three devices have a rubberized back giving them a really good grip, and they feel good in the palm of your hand. The camera on the 510 doesn't have a flash but the other two do. The 710 has physical buttons to represent the home, back and search button whereas the other two have capacitive buttons. In its overall comfort, the devices are very similar to each other. All three also house a physical camera button, which is dearly missed on some of the other devices in this comparison.

The iBall Andi 4.5h has a candy bar form factor which we like. It has a white matte finish, which makes it a good-looking device. The position of the rear camera isn't the best, especially if you want to click pictures in portrait mode. It lacks a physical camera button.

The iBall Andi 4.5q, too, has a 4.5-inch display but it is a lot heavier than the 4.5h. It
