Antec X1

Better options exist in the market

The Antec X1 is a case which is aimed at gamers who are low on budget (Seriously? At this price?). The included boxed contents and accessories are strictly barebones. Antec has done a sharp yet sophisticated job at designing the front panel. The power button also resides at the front as a centerpiece and is backlit. The back panel has space for mounting a 120mm fan with rubber fan mounts to decrease vibrations. Everything except the design of the case seems to go downhill from here on. When we look at the features part of this case, it is sad to see that there are no USB 3.0 ports, no dust filters for any fan areas, not even for the bottom mounted PSU. The drive bays are screwless but we didn't like

Price ₹3,200

their parallel placement. Cable management cutouts are big and angled that makes it easy to route cables through them but there is no space behind the motherboard tray and you will be in a pickle if you wish to tie the cables at the back. The front has a red LED fan that intakes quite a good amount of air. The case was mediocre in terms of performance as our AMD Phenom II 955 BE CPU had idle temperatures of 45°C and load temperatures of 56°C at a room temperature of 28°C. At the price we would suggest

that you look for something else as you will get the Antec One S3, Huntkey T-91 or the Bitfenix Merc Alpha, all of which are cheaper than the X1 and have more features.

ZOTAC GeForce GTX Titan

An expensive indulgence

The Nvidia Titan is a graphical powerhouse. We had been waiting to get our hands on this card since the time it was announced many months ago and ZOTAC was good enough to lend us their first card for review.

The card is currently at the pinnacle of the Kepler architecture and is based on the Tesla K20, a CUDA-based GPU that powers the world's most powerful super-computer (the Cray Titan, hence the name). The card is large, but also well-built.

The vapour-chamber cooling system is very efficient and the overall design of the card as well as its performance brings this to the fore. Temperatures rarely touched 70 even under heavy gaming and idle temperatures never exceeded 35. Our benchmarks put this card way ahead of the competition,

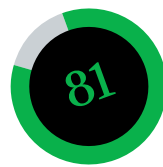

easily 20-30% ahead of the the Nvidia 680 and within shouting distance of the 690. Speaking of performance, this was the only card (barring the 690) that managed to run Arkham City at over 60fps with PhysX at extreme, this is also the only single-GPU card capable of running Crysis 3 at a barely playable 35fps when maxxed out.

All this performance does come at a real premium though. ₹68,000 is no joke and is in the same ballpark as the GTX 690, which performs better at the price. It sells at a premium, but it is powerful. This also happens to be one of the most over-clocker friendly cards according to Nvidia and testament to that is the fact that pushing it into the 3D Mark Hall of Fame was all in a night's work for us (<http://dgit.in/10ocswa>).
