Camera is the one you should have on your phone if you are into comics or graphic novels. It is a very simple app which allows you to comic-ify your photographs with interesting frame designs which will make your photograph look like it is a panel from some Japanese comic. There are a list of frames which you can download for free, if you want more variety. In terms of tweaking, you can only adjust the brightness and the thickness of the lines on the sketch. You can either share it on Facebook or Twitter or just save it to your phone.

GifBoom

If you are the kinds who love watching GIF animations online, then this is the app for you. Not only do you get to

create GIF animations, but you can also add some filters to the final GIF. The best part about the app is its simplicity. There are five main menus: Home feed, categories, camera, favourites and profile page. You login with your Twitter or Facebook credentials and click on the camera icon. Here you can either shoot in the burst mode where you will see a counter telling you how many images are being

captured or you can select the single-shot mode to click images according to your pace. You proceed to select which images you want to include in the GIF, then you can increase or decrease the speed and add various filters to your GIF. Finally you can share its link on Twitter, Facebook or Tumblr.

Camera Awesome

Only available on the iOS platform this camera app has some neat features up its sleeves. We really like the composition tool which overlays your screen with horizontal axis, rule of thirds grid and/or golden ratio graph. This ensures that you have your compositions right. You also have some preset effects which applies a particular effect to the scene you are shooting. It has separate focussing and metering points while taking a photograph. After having shot the image, you can pass it through filters and make tweaks according to your liking. The Awesomize feature enhances the image and you get a slider to see the effect. You can further tweak the sharpness, colour temperature and so on. You can then add presets, filters, textures and finally frames. You can share your images on Face-

book, Twitter, Flickr, Picasa, Photobucket or use email to send it to your friends.

Platform: iOS

Lomogram

One of the more famous photography apps on the Windows Phone OS ecosystem. It

is very straight-forward. You take a picture, and then pass it through any one of the 43 filters on offer. Each filter has a unique name, which frankly does not tell you much of what it does. Only the accompanying image gives you an idea what the filter will do. Most of the filters cater to the lo-fi aesthetic and each one comes with some amount of vignetting. After adding the appropriate filter, you can overlay it with some elements such as light leaks, textures and so on. Finally, you have an option to frame your lomograph. You can then share the picture on your Facebook, Twitter, Flickr and/or Tumblr accounts.

Retro Camera

It has a collection of retro cameras, each of which comes with its own effect. You can select the camera that you want and the interface is such that it feels as if you are looking through

a camera while making your photograph. Each camera has an info card which tells you exactly what type of photograph that camera will take. The actual scene you are shooting will be visible only in a small square with the rest of the screen real estate being used by the app UI is a bit sad. It's just another simple camera app with filters and some unique user interface. It makes an annoyingly loud shutter sound when ever it takes images with cameras. Some cameras have exposure times of 5s and more.

Platform: Android, iOS

PhotoRoom

This is a paid app on the Windows Store which is a little advanced as compared to Lomogram. It passes the photograph through three functions namely edit fx, style fx and frames. The edit fx allows you to adjust

brightness, contrast, crop image, adjust white balance and so on. Style fx comprises various filters with a slider to increase or decrease the applied effect. There isn't much tweaking you can do here. You can try out the features for free using the PhotoRoom Core app which does not allow you to change your effects. The app costs ₹55 to buy.
