Tomorrow's Travel Plans

We explore the possibilities that await us in the transportation space

Abhishek Choudhary
readersletters@thinkdigit.com

We strongly believe that approximately 0 per cent people haven't tried to envision the future. And not their own future for that matter, the future of the world. Considering that you are reading this right now, we at Digit believe that you've also spent considerable time contemplating the future of the world in the 'tech' sense. We being your technology navigators, this obvi-

ously falls under our domain, and you are therefore forbidden from crossing it alone. Which is why we've decided to cross it with you. This month, we thought we'd go about trying to explore the innovation that the travel industry has in store for us in the future. Exactly how much into the future? Well, let's just say you'll be surprised – both ways.

MagLev trains

Magnetic levitation-based transportation has been the poster-boy of the future of transportation for a long time. Too long

perhaps, seeing as how it has already been implemented at so many places that it is basically what air-travel was in the 60s – you'd have a story to tell to gaping counterparts, half of whom have no clue what you're talking about. For the majority of the world's population, the idea that there could be a shuttle that would basically be airborne (repellant magnetism at play between the bogey and the tracks is what makes this black magic possible), floating its way around and about cities at 500 kmph, is as improbable as Santa Claus driving around the world, and managing
