

## No CyanogenMod for S4

Team Hacksung, the group behind the official CyanogenMod don't plan to develop or work with Galaxy S4. <http://dgit.in/1001zvX>

## Rapidshare news

Rapidshare canned its unlimited storage service, focusing on its free and premium user service. <http://dgit.in/15rY4Ac>

Tomorrow's Tech

the most dangerous, and the most boring. Unless, of course, there is a material discovered which can be unbreakably strong and transparent at the same time (and is not spelt 'diamond') – in which case, sign us up. No sane geek can conclude a talk on futuristic travel without talking about teleportation. Not to claim sanity, but that is exactly what we're about to do here. Now, teleportation is a very interesting concept. The idea is that things be transformed into energy, and then that energy be transported the way we transport energy on these shores – via some wired or wireless transmission media. Now, you've probably heard about the fact that the voice that you hear over the telephone is not the voice of the the other person, it is a voice

If we're spared from having to tip the drivers, then we're fully on board

that is an almost exact replica of the other person's voice. Now, exactly how 'almost' we're talking about is relatively meaningless when we talk about the sound in a telephone system, but when it is actually you who are to be broken down into and then reconfigured from digital energy

sequences, we're sure you'd want the highest degree of accuracy possible – you don't want to be a different person every time you reach your destination, do you? To think that we would certainly live in a world surrounded by all these wonderful (quite literally, that) pieces of craft is, ironically, very myopic. The fact of the matter is that most of the technologies that we just discussed are either based on so long a

time frame that it would be safe to assume that they would be bent almost out of recognition by the constant design improvements. But what will almost certainly be preserved, is the idea that the future will be almost nothing like the present – exactly the way that it has always been. 

## One STOP shop for ALL Thin Clients

### AW-100

1 GHz Arm Processor  
512MB Ram/ 512MB Flash  
No Moving Components
