Power settings issue

Hi my name is Kuber Shah and I am facing a problem with my Lenovo Ideapad Z580 with the following configuration:

- CPU: Intel Core i5 3210M 2.5GHz
- RAM: 4GB
- OS: Windows 8 64-Bit
- GPU: NVIDIA Geforce GT630M 1GB

When I play heavy games like GTA IV, Assassin's Creed III, etc. the games don't work properly and lags but if I connect my charger and then play the games they work absolutely fine with maximum graphics. Please help me with this issue.

Kuber Shah

A This is because of your power setting from within Windows and also perhaps from the BIOS.

By default, on battery power, Windows under clocks the processor, if there are 2 GPUs (Intel onboard + NVIDIA) it also switches to using the onboard low spec display adapter, and also if the HDD supports it, lowers spin speeds. All this is done to make the battery last longer.

Is there a problem being connected to the charger when gaming? Surely you

Power settings adjustment

do not game on the go? You can always change your power settings within Windows, and also from the BIOS, but be warned, this will make the processor and other components always run with max power, and drain the battery super

fast even when not gaming. You can also try using hardware profiles in Windows – create one called "gaming" and turn off unnecessary services, disable unused hardware, etc, and switch to the gaming profile whenever you feel the need for gaming. We would recommend you stick to the way the laptop is now, and just plug in when you're gaming. Also remember to keep an eye on temperatures – get a laptop cooler perhaps, it might increase the life of the laptop.

Upgrading laptop?

I have a Lenovo Y550 4186 laptop with following specs:

- Processor: Core 2 Duo T6500 2.1 GHz
- RAM : 4 GB
- Motherboard : PM45
- GPU: NVIDIA GT-130M

I wish to upgrade my processor to T9600 so that latest games can be played. Please advise if upgradation is possible and also comment on compatibility of the existing Lenovo BIOS.

Ajmer Singh

A Upgrading a laptop CPU is really hard, as the motherboard may not support it, it's not assembled the same way as a desktop (which has an easily removable CPU). You can check at a laptop repair shop if they're willing to risk trying, but we'd advise against it.

Router issues

I have a big problem, and a weird one, too. I have a TP-Link TL-WR740N wireless router and an Internet connection from Reliance Broadband.

Earlier I had an Internet connection of 300Kbps Unlimited download, it used to work perfectly fine on wired as well as wireless systems. The download speed used to vary in the range of 25 to 32 KBps and I don't really remember my upload speed.

Recently I upgraded my Internet connection to 1MBps unlimited downloading Plan, but I have a lot of complaints. Now my download speed varies from 10 to 90 KBps and uploading speed is worse than ever, it varies from 1 or 2 KBps or sometime even 60KBps (very rarely). I don't know if you can help me with that, but my real problem actually is the wireless router which often gets disconnected. All my wireless devices gets disconnected from the network at the same time.

Suddenly while browsing, the data transfer shuts off and after a minute or two, even the wireless network coverage goes off. My tablet shows it as "Network Unavailable!" and does not connect. My laptop does not connect, it just keeps trying but does not connect. All the devices can detect the network but cannot connect to it.

I tried rebooting and re-configuring the router, it gets fine but then goes off again after sometime. Its irrespective of time, interval or pattern. Just out of the blue it gets disconnected, very unpredictable.

I personally think when I start using too much of the bandwidth it shuts off, like downloading and streaming from YouTube at the same time. Earlier when I had 300KBps Plan this type of disconnection happened a few times when I used to go out of range of the router, like in other room where the signal used to be weak. That time the data transfer used to shut off and router needed to be restarted but it happened just 2 to 4 times in 2 years. But ever since I got my plan updated it is happening atleast thrice a day. Help!!

Azhar Siddiqui

A Try a firmware upgrade.

This is a common problem when using torrent to download, as too many threads are opened at once. If it happens when using torrent, change the max peers to something like 200. If the router is
