

GOOGLE SEARCH

Google Search has come a long way since its introduction over a decade ago. The search engine has kept pace with changes in time and user behaviour to offer exactly what you're looking for. There are different tricks of the trade as far as Google Search is concerned and mastering them will help you get the most out of Google's search engine.

Search carousel

Probably the biggest evolution of Google Search was the integration of semantic search features in the product, known as Knowledge Graph. Users of Google Search will instantly remember it by the rectangular box that appears on the right-hand side of the search results page. A very good way to access Google Search in a whole new way is to look for suggested links towards the bottom of that Knowledge Graph box.

For instance, if you search for Leonardo DiCaprio, and look at the Knowledge Graph box on the right of the result page, it includes a treasure trove of links and images to what Google thinks you might be looking for (based on semantic search connections). Click under "Movies and TV shows" or "People also search for" to switch to carousel mode at the top of the page. Flip through these bonus search results (that you never intended to do) and you'll get new avenues of information presented in a convenient way.

Search carousel is a brilliant way to arrive at unforeseen results

Alternatives to Google Reader20

Tips & Tricks has its own page numbers, and does not follow the rest of the magazine's page numbers. This is done to ensure that you can cut out and save T&T in a separate folder for later reference.

Image search

Google's given possibly the most comprehensive overhaul to its image search feature since the service launched in 2001. Apart from the massive UI overhaul, the biggest feature was added recently. You can now bypass the need for entering a keyword and search for images by uploading an image or entering a hyperlink. It makes perfect sense for Google Images to have this feature and it makes you wonder why it took so long for engineers at Google to figure it out.

However, one of the most indispensable features of images search which isn't readily visible on the results page is the

Image search has grown into a beast, with new ways to search

ability to look for an image similar or different in size to the one you found on the search page. Look for this feature when you click on any image on the image search result page; the image expands and is displayed on a grey canvas block. In that box, click on the "Image details" button to be redirected to a related Google Search page that shows you the search keywords related to the image, its current size and lets you select whether you want to search for

a larger copy of the image. This page also lets you view images "visually" similar to the original image. Pretty cool, huh?

Handwrite

If you're accessing Google Search through a touch-enabled mobile device, along with typing and voicing your search queries aloud, you now have the ability to scribble them on to your smartphone's screen in your handwriting (if that's the quickest way for you to search). Yes, you read that right. Depending on how good your screen-scribbled handwriting is, Google understands the keyword from anywhere between a split second to a couple of seconds, which is quite snappy.

To toggle the feature on, just open Google's homepage on

your device's native browser. Access Google Search Preferences and click on the "enable" radio button under the Handwrite option. That's it. You'll now see a small "G" icon at the bottom right of Google's home page to let you know that handwriting is enabled. Write clearly and let autocomplete help you finish your keywords quicker. It works best on the native Android browser on Android 2.3 and upwards, Android 4.0+ tablets and iOS 5+ devices.
