

Android, Kindle, Windows 8 and desktop. The engine comes in 2 editions – the free version which is limited in features and the paid version which is for \$299/year. The advantage of the pro paid version is that it provides benefits such as Game Center, iAd, in-app purchasing, Android publishing and Twitter postings which is not available with other engines.

Cost: Free version which is limited in features and the paid pro version at \$299

Platforms: Web Browsers, iOS, Android, Kindle, Windows 8, Desktop

Crafty JS

Crafty.js is a modern component and an event based framework for JavaScript games that targets DOM and canvas. The component is community driven so it is constantly looking for community support to share code samples and help the component evolve.

The Crafty component unlike the other frameworks is not as simple as a plug and play but comes with advantages such as smaller footprint and makes use of something known as “Entity Component System” where the game entities (objects such as hero, enemy, wall etc) can have components (set of functions and properties) directly applied to them avoiding long chains inheritance and polymorphism.

Box2D Web

Box2DJS is Javascript port of the Box2D Physics Engine. Box2D was originally written in C++ and used on several operating systems including iOS and Android. Ports of Box2D slowly started getting written to support different environments outside C++. One of them was for the Flash Platform.

The Javascript port apparently has been completed from the Flash ActionScript version of the port. And the reason is none other than the fact that ActionScript and Javascript are both based on the ECMA-262 Standards which makes them

very familiar to any developer who might have worked on either.

Box2D is a very powerful physics engine that can simulate convex, rigid body objects interacting with each other through properties such as restitution, gravity, and friction with varying values. Many successful games have been created using this engine which makes it reliable to develop games that need good physics.

Flash JS

FlashJS is JavaScript graphics and game development engine with API similar to ActionScript. It is an HTML5 game development tool allowing writing

AS3 code within the <actionscript> code. Licenced under Apache, the framework is open source and encourages contribution from the community.

Quintus Engine

One of the newer kids on the block is the Quintus HTML5 Game Engine. Designed to be modular and lightweight, it is aimed for both mobiles and desktop. It supports an event based hybrid Object Oriented approach, has easy asset loading and sprite sheet generation. Fundamentally, it is easy to learn and games can be written in very less lines of code.

What is good about the Quintus Engine is that it has a dedicated website with a great guide on the engine components and many examples to get familiar with the engine.

IvanK Lib

This Javascript library for 2D graphics is extremely powerful for rendering graphics in games. It uses WebGL and runs on the GPU accelerated HTML5 Canvas element making it extremely fast even on low-end devices. Currently it runs on all devices that support WebGL.

IvanK.js is open source with plenty of good examples to look and learn from. The developer of this library is constantly working on stabilizing its features thus lending his commitment to evolving it.
