The Lenovo IdeaPad Y500 looks a bit like a gaming laptop, but that doesn't take away from the fact that it has been put together very nicely. The rubberized finish (also seen on the Z500) with the black colour seems to be becoming a norm with Lenovo and its high-end machines. The keys have the Alienware-ish backlighting,

making it stand out in a crowd. The keys have a little too much travel for our liking.

The HP Envy dv6 would have had the best usability ratings among all, but loses out for not having keyboard backlighting. Even more so because the rivals are offering at least row backlighting, if not individual key illumination. But there's no denying that the HP Envy has the best keyboard among all the laptops we've tested here. There are quite a few good options, but this is just the best one to type on – the spacing, travel and response seem the closest to a MacBook Pro keyboard, and that's a huge achievement. Also, you can't miss the Beats Audio branding and the down firing subwoofer that sits on the underside of the machine, while the speakers sit between the display hinges and the keyboard.

Performance

We have a variety of processors in play, and an even wider and vibrant variety of graphics options. Needless to say, performance will be critical for every laptop if it needs to score well. One thing is fairly clear from the tests: laptops in each price band seem adequately consistent in terms of specs, apart from one or two showing discrepancies.

Category 1:

₹30,000 - ₹39,999

We'll begin with the rather interesting HP Pavilion G6-2301ax. It has the AMD Quad-Core A8-4500M processor paired with the AMD Radeon HD 7640G/7670M Dual graphics. The benchmark tests put it in a solid second place, behind the HP G6-2227tu. The rest of the gang in this category gets left behind in terms of performance,

Lenovo IdeaPad Y500 (59-346619)

which includes scores for system, graphics, and battery and display tests. Clocked at 160 minutes, the HP G6-2301ax registered the best battery life test score, followed closely by the Asus VivoBook which scored 148 minutes.

rest of the configuration. Both machines have the fairly powerful AMD Radeon HD7670M graphics, while the trend among the rest is to offer only the Intel HD 4000 graphics.

If display quality is important, both Toshiba notebooks

HOW GOOD ARE THE SUPPORT SITES?

Buying the correct laptop is half the job well done. You'll need to regularly update the drivers and firmware on the laptop to enhance performance or sort out any issues.

Among the brands we've tested here, HP seems to have the best possible support website for driver and update downloads. You can either search for your laptop via the model number in the search bar, or allow the automatic detection of the product. Drivers and updates are well segregated into categories, with the version numbers and dates clearly mentioned in the listing itself.

Lenovo has also attempted to follow a similar pattern, but the website seems to be a tad slow when you're opening individual categories for download on the laptop's own support page. Similar issues with Dell's support website, which can be fairly slow at times. Dell offers the option of allowing its download utility to queue downloads. Sony, Toshiba and Asus need to do a lot of work to bring in that finesse and simplicity to their support websites.

The G6-2227tu registered the best FPS score in the Unigine Heaven test, closely followed by the G6-2301 – the difference in scores is mostly due to the

score at par with the HP G6 machines in terms of contrast and black levels. Overall, display quality on these machines is pretty much at par, but the
