Sony Xperia Z

An enticing price tag for brilliant performance

The slab design of the Xperia Z catches your attention almost instantly. No rounded edges – this is more like a bar of chocolate. On the front, and the back is a shatter proof and scratch resistant glass. Big problem though – the glass on the back caught a lot of scratches very quickly and very easily. All the connectors and slots are given their own separate covers, for the IP57 water resistance rating.

The 5-inch display on the Xperia Z is what Sony calls the “Reality Display”, and boasts of 443ppi. It is vivid, and brightness levels are fairly adequate. It is quite reflective though. The Xperia Z scored 7863 in the Quadrant test, which is second only to the HTC Butterfly. The performance of the Xperia Z is not to be taken lightly. It does not slow down no

matter what the load. The call quality is good, but the earpiece is a tad soft for noisy environments.

The much hyped 13.1MP camera does have some issues – edge noise and soft focus are apparent when you enlarge images. The colour reproduction is good though. For most general usage patterns, this is more than acceptable.

The Battery life offered by the Xperia Z's 2330mAh battery is sufficient to get you through a day at work. Pretty much in line with the likes of the recently launched HTC Butterfly, but a little below than the BlackBerry Z10.

Clearly, Sony is making a big push in the Android smartphone market, and a big display smartphone at this price is a rather enticing a deal.

Dell Inspiron 15z

This is more a laptop than an ultrabook!

For an ultrabook, you might find the Inspiron 15z a tad heavy, but much better built than the last year's ultrabook version. It looks the same as its 2012 variant, but does away with issues like flex on the chassis.

The touchscreen display is also much improved over the previous generation's offering. It is brighter, and the text rendering is much better. Colours are still not as rich as the likes of the HP Spectre XT or even the Dell XPS 14. The keyboard is well laid out and the spacing between each key is slightly more than usual. The slight tweak in the layout sees the keys like Delete, Home, Page UP and End sit in a vertical row on the right of the enter key.

The Inspiron's PC Mark 7 score of 4236 is higher than the 4061 on the HP TouchSmart 4 and 3538 on the Samsung Series 5 Touch. Its performance pegs it as a high-end laptop. The Inspiron scores 1978 in the Entry mode in the 3D Mark 11 test, while the XPS 14 had clocked 1938 in the same test. The device can handle some mild gaming though.

Battery life, with all this power, was bound to be hit. In our battery test, the Inspiron 15z clocked 130 minutes on a single charge.

Essentially, you should be buying this not for the typical ultrabook type battery backup, but for the excellent performance. We would recommend considering the 256GB SSD version.
