Everything you thought you knew
about green is wrong

By Anirudh Regidi

Everyone thinks they know what global warming is. A simplified picture goes something like this: humans produce CO₂ and other greenhouse gasses, the Earth turns into a giant greenhouse, traps most of the heat it receives from the sun, this causes global temperatures to rise and suddenly

the ice caps melt, all hell breaks loose, half the planet is drowned and the other half is toasted. And what is the supposed problem? Wind and solar energy and other such “green” power are underutilized and if we can focus on them, which our dastardly governments do not, we’ll save the world and get back to the “good ol’ days” of blue skies, chirping birds and camomile tea. How much of this is really true and how much fiction is a question

that is very hard to answer. The truth is that we simply don’t know what the hell is going on with our world. It’s getting hot, it’s getting cold. There are floods in one place and drought in another. Leading scientists claim that the temperatures are rising and CO₂ is the cause. Others claim that CO₂ has nothing to do with it and that water vapour and clouds are the actual culprits and that they’re part of an inevitable natural cycle that will take
