

and rotate at the time of scanning, to preserve the final image quality.

The other method is the grayscale mode, or 8-bit scanning that records shades of grey. This results in much larger files, but it's suitable for line-art with shades. The third method—halftone—is a format that prints black dots in a manner that simulates shades of grey.

Scanning For Fax

Scanning at 200 dpi in Line Art mode, 100 per cent is most suitable when the image has to be faxed. The easiest method would be to print the image to the fax driver directly from your scanner program. Fax always uses the Line Art mode—even if you scan it in some other mode, the fax software converts it into Line Art.

Scanning Oversized Images

If the image to be scanned is larger than your scanner glass, but its longest side is smaller than the double the longest side of your scanner's glass, you can follow this method:

Make a mark after every eight inches on the longest side of the image from the right to the left. Now, rotate the image by 180 degrees and mark it in the same manner, on the opposite longest side. Here, we assume

Scan images larger than the scanning area by dividing it into sections

that the image has a landscape orientation, i.e., its width is greater than its height. Now, align the upper-right corner of the image with that of the scanner glass. Choose the settings at which you want to scan the whole image and start the scan. Save this file as Image1.tif.
