

mal focal length and therefore magnifying objects in the image.

LZW Compression: Lempel-Ziv-Welch; a compression scheme used to reduce the size of image files.

Macro mode: A lens mode that allows you to get very close to objects so they appear greatly enlarged in the picture.

Macro Photography: This is another way of saying ‘close-up’ photography. Most cameras are unable to focus if the subject is extremely close to the lens; by using a macro lens you can come in much closer.

Manipulate: Copy, move, rotate, scale, mirror, or delete an element or group of elements.

Manual Override: Operated by hand, and by extension, any non-automatic operation.

Matrix Metering: An exposure system that breaks a scene up into a grid and evaluates each section to determine the exposure.

Megabyte: A megabyte contains 1,048,576 bytes. In other words, a million bytes is actually less than a megabyte. Abbreviated as MB.

Megapixel: Having a resolution of one million pixels. A megapixel digital camera has an image resolution of 1280 x 960 pixels or greater.

Memory Card: A card that stores information in an electronic format for digital cameras and small computers.

Memory Space: The amount of data a memory card can hold.

Memory stick: A flash memory storage device developed by Sony.

MMS: Multimedia Messaging Service is a messaging service for the mobile
