

Resolution, interpolated: A process that enlarges an image by adding extra pixels without actually capturing light from those pixels in the initial exposure.

Resolution, optical: The true resolution of an image based on the number of photosites on the surface of the image sensor.

RGB: The color system used in most digital cameras where red, green, and blue light is captured separately and then combined to create a full colour image.

Scan: The process of using an electronic input device such as a scanner to convert analogue information such as maps, photographs, overlays, etc., into a digital format usable by a computer.

Scanner: An input device that uses light to read printed information and transfers it to the computer in digital format.

SCSI port: A port that's faster than the serial and parallel ports but slower and harder to configure than the newer USB port. Also known as the Small Computer System Interface.

Sepia: A reddish-brown tone in a photograph.

Serial port: A very slow port on the computer used mainly by modems. Many digital cameras come equipped with a cable to download images through this port, but it's slow! Both parallel and USB ports are faster connections.

Shareware: Shareware is software you can download, to try before buying. If you do decide to buy it, you're expected to pay a registration fee.
