

Linear lights on the road created by car headlights in photographs shot at night

### Blur effects

Ever notice the linear lights on the road created by car headlights in photographs shot at night? The easiest way to create this effect is to use a very slow shutter speed. If you want, you can deliberately move the camera during the exposure for varied effects. You can use this blurring light technique to captivate some great compositions. For example, shoot a Giant wheel (Ferris wheel) from a tripod with a very slow shutter speed, and you will get all the stationary portions of the scene in sharp quality with some brilliant light effects on the moving parts.

### Shooting Fireworks

This can be especially tricky, since most people make the mistake of using longer exposures to capture fireworks when in reality it works the opposite way. Capturing fireworks with long exposure

#### TIP

For landscape photos, it is very often a good idea to get down. So many good landscape shots miss the chance to be great simply because we lift the camera to our faces and shoot. This may capture the inspiring scenery, but from a head-height perspective that we are all unconsciously accustomed to. Simply getting low to the ground can improve your results a lot and make your photo stand out.
