

and SATAN to attack a system. Combining these tools with a virus CAD/CAM program will allow a fully functional virus factory to create custom viruses to attack specific targets.

As these problems unfold, new methods of protection must be created. Research has hinted at several promising methods of protection, including real time security monitors that use artificial intelligence for simple decision making.

Even with the current problems and the promise of more sophisticated problems and solutions in the future, the one thing that is believed to be certain is that Unix or Unix-like systems will continue to provide a pay back that is well worth the cost of operating them.
