

Combined, these security functions and others protect each individual PC—local and remote. By distributing and enforcing PC security and security policy across all endpoints, the chances of a security breach are greatly reduced, thereby offering greater protection to the entire network. Real-world security has to be flexible: threats, organisations, and corporate networks change. It is a fact of life that attackers will learn and adapt in an attempt to circumvent defences. And, policy that once supported productivity may later thwart it. Real-world security solutions have to evolve to respond to new threats and changing organisational needs.

Flexible security policy management is critical for maintaining maximum corporate security. Policy Lifecycle Management is the key to maximizing corporate security and productivity. Centrally managed policy provides an enforcement mechanism to ensure all endpoints are compliant. Policy Lifecycle Management optimises security by streamlining policy creation and providing feedback, enforcing and updating policy at all times.
