

or financial ramifications, or threaten the health and safety of a person. The targeted system or data requires significant effort to restore or the restoration process is disruptive to the business or other systems.

Assign a risk level to each of the following: core network devices, distribution network devices, access network devices, network monitoring devices, network security devices, e-mail systems, network file servers, network print servers, network application servers (DNS and DHCP), data application servers (Oracle or other standalone applications), desktop computers, and other devices (standalone print servers and network fax machines). Network equipment such as switches, routers, DNS servers, and DHCP servers can allow further access into the network, and are therefore either medium or high risk devices. It is also possible that corruption of this equipment could cause the network itself to collapse. Such a failure can be extremely disruptive to the business.

Once you've assigned a risk level, it's necessary to identify the types of users of that system. The five most common types of users are:

- Administrators Internal users responsible for network resources
- Privileged Internal users with a need for greater access
- Users Internal users with general access
- Partners External users with a need to access some resources
- Others External users or customers

The identification of the risk level and the type of access required of each network system forms the basis of the following security matrix. The security matrix provides a quick reference for each system and a starting point for further security measures, such as creating an appropriate strategy for restricting access to network resources.

3. Establish A Security Team Structure

Create a cross-functional security team led by a Security Manager with participants from each of your company's operational areas. The representatives on the team should be aware of the security policy and the technical aspects of security design and implemen-
