

Wireless Sensor Networks: An Information Processing Approach

Authors: Feng Zhao and Leonidas Guibas

Information processing in sensor networks is a rapidly emerging area of computer science and electrical engineering research. Because of advances in micro-sensors, wireless networking and embedded processing, ad hoc networks of sensors are becoming increasingly available for commercial, military, and homeland security applications. Examples include monitoring (e.g., traffic, habitat, security), industrial sensing and diagnostics (e.g., factory, appliances), infrastructures (i.e., power grid, water distribution, waste disposal) and battle awareness (e.g., multi-target tracking).

This book introduces practitioners to the fundamental issues and technology constraints concerning various aspects of sensor networks such as information organisation, querying, routing, and self-organisation using concrete examples and does so by using concrete examples from current research and implementation efforts.
