

A typical floppy disk drive

will set you back by about Rs 550, but could save your life—until Microsoft decides to let it rest in peace.

Installing the floppy drive is similar to installing the hard drive. The only difference is the cable that plugs into it. You have to make sure that the end of the cable that has the 'cut' or 'cross-connect' end plugs into the drive. Make sure that you check for the Pin 1 on the back of the drive and accordingly insert the cable. Pin 1 is indicated by a little arrow etched onto the drive. The side of the cable that has a blue or red strip running the length of the cable plugs into the floppy drive Pin1.

Another factor you have to take care of when installing the floppy drive is its visibility on the front of the case. Make sure the floppy drive door is completely visible, and insert and eject a floppy disk in the drive to make sure that there are no obstructions in the movement of the disk due to the computer case.
