

One thing you must remember is that forms can only be used for entering data. For editing the data in a database, you will have to access the tables and then edit it as you would in a spreadsheet. Nevertheless, you can also perform these actions using queries, and this is what we'll talk about in the next section.

## 6.5 Queries

A Query is a tool that is always mentioned in the same breath as 'database'. Queries are basically commands that let you access data from the database. A query is, simply put, a question that you ask the database, and in turn get a reply in the form of results. There are three types of queries that can be used to access data. Queries can also be created using the 'Wizard' and the 'Design View'. Let us first create a query using the 'Wizard'.

Click the 'Queries' object in the Database window, and you'll find two options—'Create query in Design View' and 'Create query using Wizard'. Click 'Create query using Wizard', and you will be presented with a Wizard. Now, you need to specify the fields you would like to use in your query. You can choose all the fields from the table or just some of them.

The Query Wizard

Next, you will be presented with the option to choose whether you want to get a 'detailed view' or a 'summary view'. In most cases, a 'detailed view' will present you with all data (records) from all fields. Depending on what you want your data to look like, you can choose either option. Finally, give a name to your query, and click 'Finish' to create it.
