

'Queries', and click on the 'Query' that you made. You will then be presented with a 'Query result' window that will show you the results of the query that you ran.

6.5.3 Types Of Queries

As mentioned earlier, there are different types of queries that you can use for sorting data in a database.

m Crosstab Query

The Crosstab query enables you to summarise large amounts of data and perform calculations on that data using various types of calculations.

A Query result

m Find Duplicates Query

This query is very useful for finding redundant data in a table. Using this query, you can search for particular fields that are more prone to redundancy in a database, such as City and PIN Code in most cases.

m Find Unmatched Query

This query lets you find all the records in a table that do not have related records in any other table in the database. You can create and use these queries to cater to your specific needs.
