

Open the database in Access. Click 'Relationships' on the tool-bar, or alternatively, go to 'Tools' in the menu bar and there, click 'Relationships'. This will open the 'Show Table' dialog box. You can either choose the tables to which you want the relationships to be set to with each other, or queries, or both tables and queries.

To create relationships, you will need to drag a field from one table to that field on the other table with which you want to set the relationship. An 'Edit relationships' dialog box will appear. You can click 'Create' to set the relationship.

Once you have set the relationships, you can close the dialog box, and you will be asked if you would like to save the layout for the tables. Click 'Yes' to save the layout.

An important aspect you should remember after you set relationships is the idea of dependencies. When you create a relationship, you are creating dependencies. For

instance, when you relate ActressID on the Actresses table to ActressID on the Movie table, you are making both these fields interdependent, thereby modifying data in any table on that particular field will affect the data in both the tables.

To check dependencies for particular objects, in the database window, go to tables and right-click that particular table, and click 'Object Dependencies'. This will open a task pane showing the dependencies of that object on other objects.

Creating Relationships
