

This confirmed Kleinrock's theory of the need for packet switching since the circuit-switched telephone system was insufficient for the job. This also proved another aspect, which was that time-shared computers could work well together and running programs or retrieving data could be carried out without any issues.

The word "packet" was adopted from the work at NPL and the proposed line speed to be used in the ARPANET design was upgraded from 2.4 kbps to 50 kbps.
