

Let's take a look at MS FrontPage:

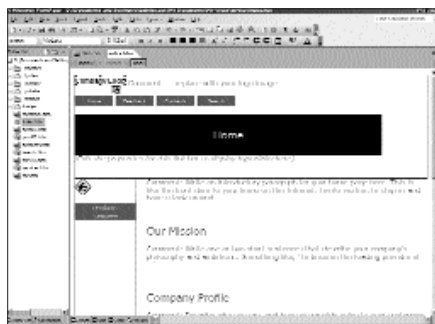

1. When you run FrontPage, it starts off with a blank page.

Choose what pages you want to include

2. You can choose to build a site from a template. There are several templates available—choose one that matches your needs.

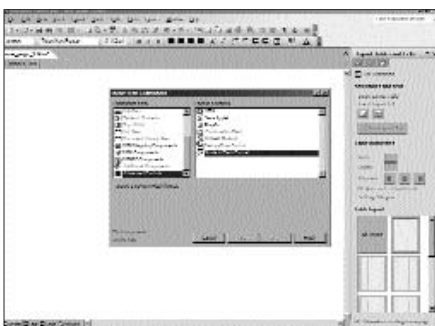

3. We chose to build a 'Corporate Presence' site.

Just click on each box to edit its contents

4. Change the logos and add suitable text where clearly marked, and save each page.

5. Check the pages you've designed in different browsers by going to File > Preview In Browser.

Choose to insert Web components when you want to include Flash movies, Java applets or ActiveX Controls

6. Once all the pages have been edited, upload the entire Web folder to your hosting server.

7. Check all the pages again, and your site is done.
