

Mobile Entertainment: Consumer Issues

The implementation and success of mobile entertainment products, business models, technologies and content relies ultimately on the creation and ongoing development of a solid end-user market. Secure, transparent, and reliable billing and micro-billing systems for mobile entertainment products and services must be implemented as swiftly and as effectively as possible.

Finally, mobile entertainment must, above all, be entertaining (and to a certain extent ‘useful’) to the consumer. Without sufficient understanding of the social contexts in which mobile entertainment is embedded it is unlikely that consumers will come to think of mobile entertainment products and services as significant components of leisure practices.
