

ExEn turns mobile phone into portable consoles. Once downloaded, games display a fireworks of new features.

Working as a virtual machine, ExEn is also a safe engine for handsets preventing many of security issues (viruses, crashes...) that occur when games are run locally. Part of ExEn's development is dedicated to security: the software provides built-in identification, useful for billing, statistics, data mining, customisation, etc..

Since July 2001, In-Fusio registers over 3,000,000 interactions per month without any problem related to functioning of the games engine.

BREW

BREW stands for Binary Runtime Environment for Wireless. BREW allows users to select, purchase and download, over-the-air, a variety of games, ringtones, entertainment options and productivity programs—anytime, anywhere—directly to their BREW-enabled device.

BREW is not an OS; it is an environment in which applications run—hence Binary Runtime Environment for Wireless. The BREW platform does not preclude an operating system from being run on a device. In fact, the BREW platform can co-exist and complement an operating system running on the same device. BREW technology allows the OS to access embedding chip functionality, such as MP3 and MPEG4 capabilities; however, it is interposed between applications and core system functions—thus protecting the handset operating system.

One does not pay extra for BREW to be installed on the device. One does have to pay for applications one downloads and uses via the BREW service.

Palm OS

Since the introduction of the first Palm Pilot in 1996, the Palm OS platform has defined the trends and expectations for mobile computing—from the way people use handhelds as personal
