AAC

AAC or Advanced Audio Coding is a MPEG-2/MPEG-4 and is the audio codec of choice for Internet, wireless and digital broadcast. This is a good option if you want to stream audio or want your audio to consume a smaller footprint of your total data. AAC encoding is extremely efficient and easily surpasses the MP3 codec and provides surround sound options. The MPEG group that

Adding the song to be converted in iTunes

includes Dolby, Fraunhofer (FhG), AT&T, Sony and Nokia developed AAC, top of the line companies, also involved in manufacturing equipment that affects our daily lives.

For converting our .WAV audio file to an AAC file, we will need to use iTunes which is freely downloadable from the Apple website. Once you have downloaded and installed the software, follow these instructions to create your AAC file.

First click on File- Add File to Library, then browse, and locate the file that you want to encode.
