

3.2 Basics Of Video

So What Is Video?

Video is nothing but a series of still images, displayed fast, one after the other. Each still image is called a frame, and the rate at which the images are displayed are called a video's frame rate. Since the human eye is only capable of seeing less than 25 different images per second, any video that has a frame rate of 25 frames per second (fps) or more appears to have smooth movement, just as we perceive movement in real life!

If a video displays less than 25 different frames per second (fps), it appears to be jerky, and our eyes can perceive the breaks in movement.
