

Picasa also lets you 'tune' an image in six different ways

ple resemble hounds caught in the headlights. But no more!

Among all the tools we have seen, we are about to stick our neck out and say this is the easiest and among the more reliable ones to use. Once activated, you'll see a 'draw' kind of tool that lets you pull a square around the red-eye. That's it. That's all you have to do. The rest is done by the program. Now, we had quite a range of red-eyed photos, and we're thrilled to report that our success rate was about 98 per cent. Impressive.

Moving along, the Tuning option allows some more control over image attributes and lets you adjust 'Fill Light', 'Highlights', 'Shadows' and 'Colour Temperature', and also lets you pick a neutral colour. The most impressive of all these is the 'Fill Light' function, which will fill in light in any underexposed areas. Manual control is available here, and you can choose how much light you want 'filled in' into your photos.

'Effects' is more for playing around with your images, and we strongly suggest creating a backup before venturing into this.
