

4.2.2 QuickTime Alternative

QuickTime Alternative is a simple, low-maintenance multimedia player devoid of any ads or bells and whistles that have now become *de rigueur* in most free media players. At 10 MB, it's a very small download. This comes as a relief, since the official QuickTime Player from Apple, at 24 MB, has become an extremely bloated download and an even bigger installation. To add to this, the latest versions come loaded with iTunes, which just about adds to the bulk of the application. QuickTime Alternative makes it possible to play QuickTime files without having to install Apple's QuickTime Player, allowing you to use the player of your choice for multimedia playback. The open source Media Player Classic, not to be confused with Windows Media Player, is included in the download and is the default player.

This full-featured player has internal decoding support for DVD, MPEG-2, MP3, MP2, AAC, AC3 and DTS. It also has internal support for opening Matroska and Ogg containers. The player is chosen as the default player for those files associated with Quick Time Alternative.
