

Maxthon supports HTML 4.01, XHTML 1.0, JavaScript, the DOM Level 1 and CSS-1, and unlike IE6, it does it without too many problems and maintains stability. However, like its parent software, a genuine attempt at CSS-2 support is sadly lacking, especially considering IE5 on the Mac has excellent support for it. The interface is still good and it's relatively speedy when rendering Web pages, but its lack of support for CSS specifications that were standardised in 1998 is a huge problem.

Some of the other negatives include the fact that it is prone to crashing just like IE6, but in this browser, security flaws inherent to IE6 have been fixed. These flaws have naturally been carried over from IE6, as Maxthon uses the same rendering code.

Maxthon has a very simple yet effective pop-up blocker, which reduces the annoyance of pop-up ads, which seem to have a strong affinity for IE! Overall, it's a good browser, but is not in the same league as Opera or Firefox. Strictly for those who prefer IE-like Web page rendering.

Fast, light and stable... Maxthon seems to have everything going for it
