

2. Disable Error Reporting

The error reporting feature is a complete annoyance and a resource hog. It pops up when an application fails. As you've probably seen, the feature exists so problems can be reported to Microsoft. Simply switch off this service off without a second thought!

At the bottom of the 'Advanced' tab in 'System Properties' is a button called 'Error Reporting'. Click the button to open the 'Settings' page, and then select 'Disable Error reporting'. You can even choose to disable error notifying as well by unselecting 'But notify me when critical errors occur'. Apply the changes and press 'OK'.

Disabling Error Reporting

3. Disable Remote Assistance

This is another service you can disable to free up system resources. In 'System Properties', select the 'Remote' tab. Uncheck 'Allow remote assistance'. If you have a standalone PC without a network connection, it's a good idea to switch off the 'Remote Desktop' feature as well—just uncheck the 'Allow users to connect remotely' checkbox.

Disabling Remote Assistance
