

in program versions between the connected systems, or it could be that one system does not have the latest network drivers. The best way to solve this is to verify that the programs you're using on the different systems are of same version. Also, it's advisable to update your LAN card driver—go to Control Panel > System > Hardware > Device Manager > Network Adaptors, right-click on the LAN card displayed in Network Adaptors, and select Update Driver. Make sure you have the updated driver handy—the system will ask for its location.

If the TCP/IP protocol files are corrupt, you need to reinstall them. Go to Control Panel > Network Connections, select the Local Area Connection, right-click it and go to Properties. Select “Internet Protocol (TCP/IP)”, un-

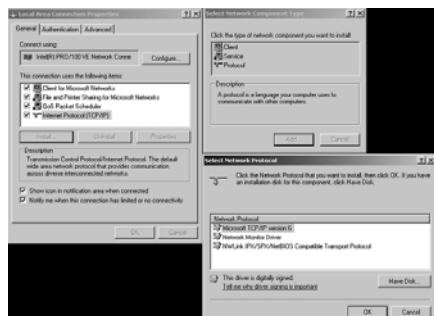

Updating the LAN drivers

install it, reboot your computer and reinstall it. If you don't find the protocol after rebooting, return to the menu, click Install > Protocol > Add, and select TCP/IP.

What Icon?

If you can't see the network icon in the system tray, it's only because it isn't set to be displayed. By default, the system tray network icon is not enabled in certain Windows versions. To enable the system icon, go to Control Panel > Network Connection > Local Area Connection,
