

into documents. To insert a formula from Math into Writer or Impress, go to **Insert > Object > Formula**. The Math window opens up, and you can choose from the different formulas listed.

We will take you through the features of Open Office so you can start your work the moment your Linux installation is done!

5.2.1 Open Office Writer

Typically found in the Office tab, opening it is nothing more than a two to three mouse click event. When you open Writer, the icons will seem more or less like those in MS Office. But you will see a well-defined box inside which you can type. This is nothing but the actual text area shown separately from the margins. If you're confused about a feature or option, choose the Help menu. There are detailed indexed help topics available.

Attention has been paid to detail, and this is very apparent—no feature available on commercial, proprietary office suites is left out. Menus and sub-menus are intuitively placed in Microsoft Office style.

The number of fonts in Writer, however, is very small compared to its Windows counterpart, at least in the quick install of Fedora that we did. The all-time-favourite Times New Roman is not available, but you'll find an exotic-sounding Nimbus Roman as the default. In place of Wingdings, you'll find fonts called Open Symbol and Standard symbol.

Comments marked into documents with MS Office can also be viewed and edited with Writer. You can also store in the .doc format for Word 95 or XP—good compatibility here!

5.2.2 Open Office Draw

Imagine something as simple as a paintbrush app, but with many, many more drawing tools. And more fun too. Take a look at Open Office draw. At *Digit*, we got pretty busy playing around with this wonderful, fun-filled tool! You can, of course, use this tool in
