

Stage III: Animating the Cursor

This is the simplest part. In the Animation Palette (Window > Animation), drag the first frame onto the New Frame button to duplicate it. In the second frame, turn off the visibility for the underscore layer. Set the delay for each frame to 0.5 seconds, and set the animation to loop forever. Play the animation to watch your new retro DOS prompt.

Save this animation by going to *File > Save Optimized as* and choosing GIF.

Creating the Security Camera Effect

With a few little enhancements, we can use the above method in Photoshop to make an image look like it was taken from a security camera. Follow the same procedure to create the interlaced layer, only this time add just a little noise to the interlaced layer (Filter > Noise > Add Noise) and add a little Gaussian noise with the Monochromatic option on.

Desaturate the underlying image using Image > Adjustments > Desaturate. Security camera footage tends to look a little washed out, so adjust the curves (Images > Adjustments > Curves) to get the effect you want.
