

1.3.9 Customising your Workspace

Different people use Photoshop differently, and for different purposes. Moreover, you're going to need a different set of palettes depending on what you're trying to do—analysing images, working with text, painting, and so on. Photoshop lets you save as many workspaces as you like, so you don't have to keep enabling and disabling palettes each time you want to do something new. Photoshop CS2 even comes with a bunch of preset Workspaces designed for activities such as Web design or colour correction. You can also see what's new in version CS2 by selecting the “What's new - CS2” Workspace. To begin customising your workspace, use the Window > Workspace menu.

Customising Menus

As of Photoshop CS2, customising your Workspace took one giant leap ahead of CS—you can now change the keyboard shortcuts to suit you, enable or disable items from any of the menus, and assign colours to menu items

Customising keyboard shortcuts

you want to highlight (or just to make your Workspace pretty). For example, the “What's New - CS2” workspace highlights all the new menu items in blue.
