

The Tree is Freed!

you want to retain it for later use, you should use the Extract filter on a duplicated layer.

If the image you are using has a strongly-textured background or foreground, you should enable the Textured Image checkbox and adjust the Smoothing to get the extraction right—keep using the Preview button to check what the result will look like.

If your image is especially intricate or made up of different shades of the same colour, check the Force Foreground option to set which area will be extracted. Use the eyedropper tool to select which colour will be treated as the foreground and then proceed to highlight the area you want to extract.
