

5.1.3 Bevel and Emboss

A very popular style is the Bevel and Emboss effect, especially for text. This gives the layer the effect of being a 3D object placed on top of the background layer. When used on text, you can make the text look like it's been chiselled from a solid block. You can control the height of the Bevel or Emboss and also the lighting and shadows. You can play around with the various options and settings to achieve the desired effect.
