

Both time and frequency
are altered in this type of effect

clip run faster, the sound will also come out a lot higher than it should.

Adobe Audition throws in all time and pitch effects under Effects > Time/Pitch, while Audacity has them under Effects as Change Pitch, Change Speed (both time and pitch will be affected), and Change Tempo (only time will be affected).

7.2.2 Reverbs

Reverberation effects—or simply “reverbs”—can be used to simulate the natural effect of sound bouncing off surfaces and creating echoes. These echoes occur so quickly that the human ear barely make out the difference between the original sound and the echo. Still, the effect is strong enough to for us to be able to identify the environment, be it a tiled bathroom or a cramped closet.

So even if you’ve got the studio version of a song, you could use the reverb effect to give it a “concert hall” sound and brag to your friends about how you have a rare live version.
