

Your audio editor will give you a lot of flexibility when it comes to simulating these real-life effects—you can enter the size of the room, the damping (how much strength the sound loses when it bounces off a surface), and many other parameters. Audition's Full Reverb effect offers you enough options to make you dizzy, and the sound quality is quite impressive as well.

### 7.2.3 Flanges and Wahwahs

In audio lingo, flanging is mixing identical audio signals, albeit with one slightly delayed. The delay is usually not fixed, and varies over a small range. The resulting sound is a strange, psychedelic effect reminiscent of the weird, “trippy” music of the '60s and '70s. This is much like listening to music through a long drainpipe.

Audition's Flanger

The funny-sounding wahwah effect gets its name from the guitar special-effect pedal by the same name. The wahwah effect gives music a very expressive, pulsing feel—much like saying “wah” or the siren of an ambulance.

An innocent guitar riff... and then... Wahwah!
